

ABSTRACT OF DISCLOSURE

The present invention relates to a method of selectively reproducing a desired type of data from a multi-session disk in which various types of data have been recorded on sessions. The method of
5 reproducing a recording medium containing same type of contents in each session identifies each type of a plurality of sessions sequentially, composes type telling information based on the identified types wherein information indicative of same type of data sections is to be collectively placed when the type telling
10 information is viewed, presents the type telling information with a choice button or box for a user's selecting an arbitrary type, and selectively reproduces data sections corresponding to a selected type from a user. According to this method, it is possible for a user to recognize easily all types of data recorded on a multi-session disk
15 containing various types of data, whereby a user can request reproduction or copy of same type data quite conveniently.
